AIMS AND SCOPE

Pavement Engineering lies at the heart of modern society in both technologically advanced and developing countries. Delivery of goods and services to markets and consumers depends on the provision of reliable highway and airport pavement systems. The International Journal of Pavement Engineering is dedicated to the publication of cutting edge research and development in such important types of structures and facilities, including advanced analytical and computational techniques, pavement mechanics, laboratory techniques, non-destructive testing, innovative design approaches and their implementation, construction, performance, maintenance and rehabilitation techniques. The Journal publishes the latest research findings from all over the world together with case records of successful (and not-so-successful) usage and performance results. Hence, one of the journal aims is to bring to gather and disseminate results of research and practice from one country to another. Occasionally, there are state-of-the-art reviews on pavement engineering aiming to transfer advanced pavement understanding to the user community as well as special issues focusing on subjects of importance and interest to the pavement community.

ABSTRACTING AND INDEXING SERVICES

CONTENTS

Editorial:
High-speed railway infrastructure: recent developments and performance
K. Giannakos

Development of a time–frequency approach to quantify railroad ballast fouling condition using ultra-wide band ground-penetrating radar data
I.L. Al-Qudh, W. Xie, D.L. Jones and R. Roberts

Dynamic aspects of rail tracks for high-speed railways
D. Adam, H. Brandl and I. Paulmichl

RHEDA 2000®: ballastless track systems for high-speed rail applications
S. Freudestein

New possibilities to reduce track costs on high-speed lines using a bituminous sub-ballast layer
P.F. Teixeira, A. López-Pita and P.A. Ferreira

Inspection of railroad ballast using geophysical method
C. Plati, A. Loizos and V. Papavasilion

Theoretical calculation of the track mass in the motion of unsprung masses in relation to track dynamic stiffness and damping
K. Giannakos
